# Ontologies, semantic annotation and GATE

---

**Kalina Bontcheva**  
**Johann Petrak**  
**University of Sheffield**

---

# Topics

- 
- Ontologies
  - Semantic annotation
  - Ontology population
  - Ontology learning

# Ontology - What?

- 
- “An Ontology is a formal specification of a shared conceptualisation.” [Gruber]
  - Set of concepts (instances and classes)
  - Relationships between concepts (is-a, is-subclass, is-part, located-in)
  - Allows reasoning
    - Class membership, inferred properties ...
    - Need tradeoff: expressivity vs. reasoning complexity and decidability

# Ontology – How?

- 
- **RDF/RDFS** – Triple-based representation scheme
  - **OWL 1.1 / OWL 2** – Ontology representation formalism based on RDF/RDFS
  - **Description Logic** – Logic based KR formalism used for OWL, allows well-defined sublanguages.
  - OWL 1.1: OWL-Lite, OWL-DL, OWL-Full official sublanguages, several unofficial others
  - OWL 2: language profiles  
==> expressiveness / reasoning effort trade-off

# OWL – Issues

- 
- **OWA** – Open World Assumption: if something is not in the ontology, it can still be true
  - **No UNA** – No Unique Name Assumption: one entity can have different names
  - **owl:Class** vs. **rdfs:Class**

# Ontologies in GATE

---

- Abstract ontology model for the API:
- Comes with one concrete implementation preinstalled: Sesame/OWLIM
- Comes with several tools:
  - Ontology Visualizer/Editor
  - OntoGazetteer, OntoRootGazetteer
  - Ontology support in JAPE

# Ontology implementation

- 
- SwiftOWLIM2 from Ontotext
  - A Sesame1 repository SAIL
  - Fast in memory repository, scales to millions of statements (depending on RAM)
  - Supports “almost OWL-Lite”
  - SwiftOWLIM is exchangeable with persistence-based BigOWLIM: not free, scales to billions of statements.
  - Planned: Migration to Sesame2/OWLIM3

# Ontology API

- 
- Ontology, Ontology resources represented as Java objects: `gate.creole.ontology`
  - Ontology, OClass, OResource, URI, Literal
  - Currently: ~ OWL-Lite actions
  - OWLIMOntologyLR is a Java Ontology object
  - JAPE RHS can access Ontology object

# Ontology API

---

```
URI uri = new URI("http://my.uri/#Class1", false);  
  
OClass c = ontology.addClass(uri);  
  
Datatype dt = new Datatype(XMLStringURI);  
  
DatatypeProperty dtp =  
    ontology.addDatatypeProperty(uri2, domain, dt);  
  
OInstance i = ontology.addOInstance(uri3, c);  
  
Set<OClass> scs =  
    c.getSuperClasses(DIRECT_CLOSURE);  
  
i.addDatatypePropertyValue(dtp,  
    new Literal("thevalue"));
```

# Ontology Viewer/Editor

- 
- Basic viewing of ontologies, to allow their linking to texts via semantic annotation
  - Some edit functionalities:
    - create new concepts and instances
    - define new properties and property values
    - deletion
  - Some limitations of what's supported, basically chosen from practical needs for semantic annotation
  - Not a Protege replacement

# Ontology Editor

The screenshot displays the GATE Developer 5.0 build 3244 interface. The main window is titled "GATE Developer 5.0 build 3244" and contains several panes:

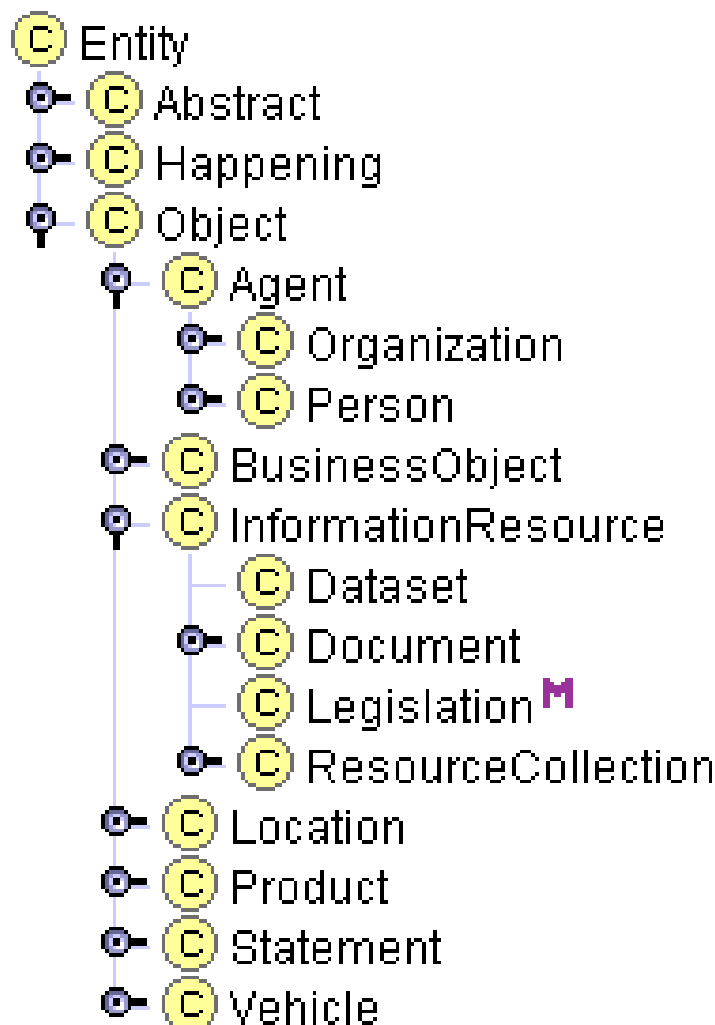

- Left Pane:** A navigation tree with categories like "Applications", "Language Resources", "Processing Resources", and "Data stores". The "protonust-popul..." ontology is selected.
- Classes & Instances Pane:** A tree view showing the ontology's structure. Classes include Forest, Jungle, Oasis, Tundra, Cape, Cave, Coast, Continent, Africa, Asia, Europe, North America, North America, Create, Delta, Gap, Island, Archipelago, Isthmus, Mountain, MountainRange, MountainSummit, Ridge, Volcano, Peninsula, Plain, Plateau, Reef, and Valley.
- Properties Pane:** A context menu is open over the "Asia" class, listing various properties such as "hasChild", "hasSpouse", "hasUniversity", "hasMobilePhone", "hasFather", "hasInternetAddress", "hasSister", "comment", "hasParent", "hasContactInfo", and "hasEMail".
- Resource Information Pane:** Shows details for the "Asia" instance, including its URI (<http://gate.ac.uk/owlim#Asia>), its type (Ontology Instance), and a list of "Direct Types" (Continent) and "All Types" (LandRegion, Location, Continent).

# PROTON Ontology

- a light-weight upper-level ontology;
- 250 NE classes;
- 100 relations and attributes;
- 200.000 entity descriptions;
- covers mostly **NE classes**, and ignores general concepts;
- includes classes representing **lexical resources**.

[proton.semanticweb.org](http://proton.semanticweb.org)

# Hands-on 1

---

- Load Ontology\_Tools plugin
- Language Resource → New → OWLIMOntologyLR
  - URI: load from web or from local file: load protonust.owl
  - Format: rdfxml, ntriples, turtle
  - Default default NS: <http://gate.ac.uk/owlim#>
- Resolves all imports automatically when loading
- Double-click ontology LR to view/edit

# Semantic Annotation

---

- “Semantic”: link the annotation to a concept in an ontology.
- The semantic link connects the text mention to knowledge about the concept that is mentioned.
- The mention can link to an instance, a class, or a property – i.e. to a resource
- Use the semantic link to access additional data about the concept – use for disambiguation and further annotation processing
- Use for NER, IE, querying, ...

# Semantic Annotation

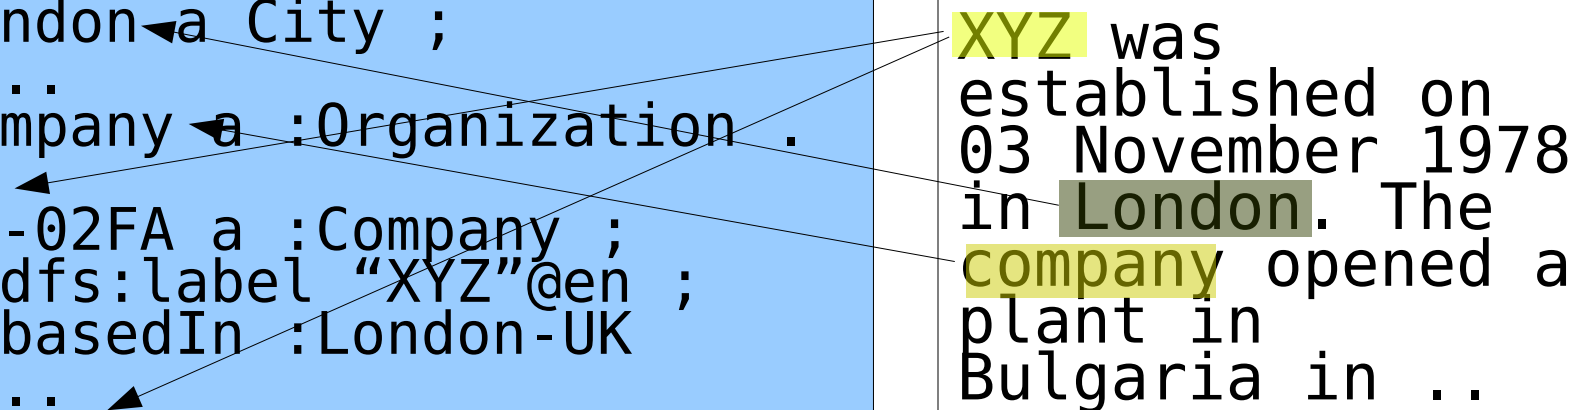

## Ontology

```

:London a City ;

# Semantic Annotation vs. “traditional”

- 
- Link to hierarchy of concepts instead of flat set of concepts
  - Larger space of possible annotations
  - - harder to get it right
  - + candidate concepts have associated knowledge that can be used to support decision
  - + found concepts can be generalized based on ontology:  $\text{context}(\text{company}) < \text{context}(\text{organization})$
  - → ontology aware JAPE in GATE

## Semantic Annotation: How?

---

- Manually: ontology based annotation – GATE OAT (Ontology Annotation Tool)
- Automatically
  - Gazetteer/rule/pattern based
  - Similarity based
  - Classifier (ML) based
  - Parser based
  - Combinations thereof

# GATE OAT

---

- Show document and ontology class hierarchy side-by-side
- Interactive creation of annotations that link to the ontology class/instance
- Allows on-the-fly instance creation
- For:
  - Creating Evaluation Corpus
  - Creating ML-Training Corpus

# OAT

The screenshot shows the GATE Developer 5.0 build 3244 interface. The main window displays a document with text and various annotations. A dialog box is open over the text, showing the OAT (Ontology Annotation Tool) configuration. The dialog box has the following fields:

- Apply To All:
- Create Instance:
- Dehighlight:
- ontology:
- class:
- label:
- seeAlso:

The background text in the document editor is as follows:

The European Central Bank yesterday shrugged off evidence of a worse than expected slowdown in the global economy and kept interest rates in the 12-nation zone unchanged at 4.5%.

Although Bank of England fears about the darkening outlook for the world economy prompted a surprise cut in British interest rates yesterday, the ECB declined the opportunity to join global efforts to boost flagging growth.

Its decision came despite data which showed economic confidence in Europe continuing to collapse and a further fall in US manufacturing orders as American industry struggles to climb out of recession.

The ECB has cut interest rates once this year, compared with six cuts by the US Federal Reserve and four by the Bank of England's monetary policy committee.

"Compared with more of a price increase in the US, the UK showed consumer confidence at its lowest level for two years.

The OAT dialog box is currently set to create instances of the 'Number' class from the 'proton' ontology. The 'label' and 'seeAlso' fields are currently empty.

# OAT

The screenshot shows the OAT application window. At the top, there is a toolbar with navigation arrows, a satellite icon, and three checkboxes: "Apply To All", "Create Instance", and "Dehighlight". Below the toolbar is a search input field containing the text "Product". A list of ontology classes is displayed below the search field, each preceded by a red circle containing a white 'C'. The classes are: Product (green background), CarModel (light green background), AirplaneModel (yellow-green background), WeaponModelOrSystem (orange background), ChemicalCompound (red background), Beverage (green background), AlcoholicBeverage (orange background), and Drug (green background). The window has a standard Windows-style title bar and a close button in the top right corner.

# OAT

Ontology Tree(s) Options

- Disable Child Feature
- Enable confirm deletion
- Case Sensitive "Annotate All" Feature
- Disable Filtering**
- Classes to ommit
- File:
- Classes to show
- File:
- Selected Text As Property Value?
- Annotation Property :
- Annotation Set :
  - Default Annotation Set
  - ▼
- Annotation Type :
  - Mention
  - ▼

## Hands-on 2

---

- (Load Ontology\_Tools plugin)
- Load ontology protonust.owl
- Load a document from `corpus_original` (encoding iso-8859-1)
- Create annotation
- Create annotation and instance
- Load document from `corpus_annotated` and show annotations

# Semantic Annotation: Automatic

---

- Create language resources from existing ontology:
  - Retrieve or generate possible mentions and create gazetteer lists or gazetteer
  - Preprocess document
  - Annotate document with gazetteer
  - Disambiguation, postprocessing

# OntoGazetteer

---

- Map ontology classes to gazetteer lists
- e.g. List of first names to class “Person”
- Uses Hash Gazetteer internally
- Provides a GUI to establish the mappings
- Mapping file could also be created by other means
  - Gazetteer list file name / ontology class URI
- For simple situations w/ few classes and many instances per class

# OntoGazetteer

GATE 3.1-beta1 build 2225

# Onto Root Gazetteer

---

- Tries to find mentions in resource names (fragement ids), data property values, labels
- Converts “CamelCase” names, hyphen, underscore
- Produce multiword subsequences
- Finds lemma of mentions using the GATE Morphological Analyzer
- Creates a gazetteer PR that can be used with the FlexibleGazetteerPR

# Onto Root Gazetteer

---

- OntoRootGazeteer:
  - Generate candidate list from ontology
  - Run Tokeniser, POS tagger, Morphological Analyser(M.A.) and find lemmata/stems
- Document pipeline:
  - Run Tokenizer, POS tagger, M.A. and find lemmata/stems and place in Token.root
- Flexible gazetteer:
  - Match Token.root (*not text* as DefaultGazetteer) using OntoRootGazetteer

# Hands-on 3

---

- Plugin Ontology\_Tools for OntoRootGazetteer
- Plugin Tools for GATE Morphological Analyser
- Load Ontology
- Create Tokeniser, POS Tagger, and Morphological Analyser
- Create and configure OntoRootGazetteer
- Create Flexible Gazetteer
  - add OntoRootGazetteer as gazetteerInst
  - Specify Token.root for inputFeatureNames

# Hands-on 3

Parameters for the new Onto Root Gazetteer

Name:

Name	Type	Required	Value
caseSensitive	java.lang.Boolean	<input checked="" type="checkbox"/>	false
considerHeuristicRules	java.lang.Boolean	<input checked="" type="checkbox"/>	false
considerProperties	java.lang.Boolean	<input checked="" type="checkbox"/>	true
morpher	gate.creole.morph.Morph	<input checked="" type="checkbox"/>	MorphAnal
ontology	gate.creole.ontology.Ontology	<input checked="" type="checkbox"/>	<none>
posTagger	gate.creole.POSTagger	<input checked="" type="checkbox"/>	<none>
propertiesToExclude	java.lang.String	<input type="checkbox"/>	
propertiesToInclude	java.lang.String	<input type="checkbox"/>	
separateCamelCasedWords	java.lang.Boolean	<input checked="" type="checkbox"/>	true
tokeniser	gate.creole.tokeniser.DefaultTokeniser	<input checked="" type="checkbox"/>	<none>
useResourceUri	java.lang.Boolean	<input checked="" type="checkbox"/>	true

OK Help Cancel

Ontology LR

POS Tagger PR

Tokeniser PR

# Hands-on 3

---

- Create pipeline
- Create and add Sentence splitter
- Add Tokeniser
- Add POS Tagger
- Add Morphological Analyser
- Add Flexible Gazetteer
- Run

# Postprocess

---

- Original annotations contain just candidate URIs and classes.
- Original annotations might overlap
- Pull in additional knowledge for
  - Disambiguation (which person of that name?)
  - Semantic enrichment for subsequent processing stages

# Ontology-aware JAPE

---

```
Rule: LocationLookup
(
  {Lookup.class == Location}
):location
->
:location.Location = { }
```

*Matches any name  
of a class that is a  
subclass of Location*

# Ontology Population

---

- Annotate document and find mentions of what could be (new) instances in the ontology
  - Use traditional NER, linked to ontology
  - Use semantic annotation based on existing knowledge
  - Use ML
- Create ontology instances and property values (“ABOX”) from the final annotations

# Ontology population

:London ← a City ;  
:Company ← a :Organization .

XYZ was established on 03 November 1978 in London. The company opened a plant in Bulgaria in ..

# Ontology population

---

:London ← a City ;  
:Company ← a :Organization .

XYZ was established on 03 November 1978 in London. The company opened a plant in Bulgaria in ..

# Ontology population

---

```
:London a City ;  
:Company a :Organization .
```

```
:XYZ-001 a :Company ;  
:established-in :London .
```

XYZ was established on 03 November 1978 in London. The company opened a plant in Bulgaria in ..

# Ontology Population

---

- Populate Ontology with Instances:
  - Of classes
  - Of properties connecting class instances with other class instances or values (literals)
  - Graph describing n-ary relations or events ...
- Strategy
  - Place in domain ontology?
  - Place in intermediate ontology/KB?

# Ontology Population

---

- Place directly in domain ontology:
  - + Simple & straight-forward
  - Cannot model likelihoods, hard to model meta information (where from, which context)
  - Can easily leave sub-language or become inconsistent
  - Knowledge arrives incrementally but has dependencies
- Place in intermediate ontology
  - Processing more complex
  - Apropriate model for intermediate ontology?
  - + Can do iterative improvement
  - Can model meta information

# Ontology Population: JAPE

---

```
Rule: FindEntities                                     Use qualified name!
({Mention}):mention
->
:mention{                                           Check if null!
  Annotation mentionAnn =
    (Annotation)mentionAnnots
      .iterator().next();

  String className =
    (String)mentionAnn
      .getFeature().get("class");

  List<Resource> matches =
    ontology.getResourcesByName(className);
```

## Ontology Population: JAPE

---

```
// find the resource representing the class
for(OResource aResource : matches ) {
    if(aResource instanceof Oclass) {
        aClass = (Oclass) aResource;
        Break;
    }
}

// get Text of mention
String mentionName =
    doc.getContent().
    getContent() (
        mentionAnn.getStartNode().getOffset(),
        mentionAnn.getEndNode().getOffset()).
    toString();
```

# Ontology Population: JAPE

---

```
// populate the ontology
gate.creole.ontolog.URI uri =
    OntologyUtilities.createURI(
        Ontology, mentionName, false);

if(!ontology.contains0Instance(uri)) {
    ontology.add0Instance(uri, aClass);
}
```

# Hands-on 4

---

- Open protonust.owl ontology
- Create corpus from corpus\_annotated (encoding iso-8859-1)
- Create JAPE file populate.jape or download populate.jape from <http://gate.ac.uk/wiki/Upload.jsp?page=FIG09>
- Create Pipeline and run JAPE transducer
- View ontology

# Recap

---

- **Semantic Annotation**
  - Mentions of instances in the text are annotated wrt concepts (classes) in the ontology.
  - Requires that instances are disambiguated.
  - It is the **text** which is modified.
- **Ontology Population**
  - Generates new instances in an ontology from a text.
  - Links unique mentions of instances in the text to instances of concepts in the ontology.
  - It is the **ontology** which is modified.

# Ontology Learning

---

- **Extraction** of (domain) ontologies from natural language text
  - Machine learning
  - Natural language processing
- **Tools:** OntoLearn, OntoLT, ASIUM, Mo’K Workbench, JATKE, TextToOnto, ...

# Ontology Learning – Tasks

## Concept extraction

car, vehicle, person

## Concept classification

subclass-of( car, vehicle )

## Instance extraction

Peter, his-car

## Instance classification

instance-of( Peter, person )

## Relation extraction

drive( person, car )

## Relation instance extraction

drive( Peter, his-car )

# OL – Problems

## Text Understanding

- Words are ambiguous
  - ‘A bank is a financial institution. A bank is a piece of furniture.’
- `subclass-of( bank, financial institution ) ?`
- Natural Language is informal
  - ‘The sea is water.’
- `subclass-of( sea, water ) ?`
- Sentences may be underspecified
  - ‘Mary started the book.’
- `read( Mary, book_1 ) ?`
- Anaphores
  - ‘Peter lives in Munich. This is a city in Bavaria.’
  - `instance-of( Munich, city ) ?`
- Metaphores, ...

# OL – Problems

## Knowledge Modeling

---

- What is an instance / concept?
  - ‘The koala is an animal living in Australia.’
    - `instance-of( koala, animal )`
    - `subclass-of( koala, animal )` ?
- How to deal with opinions and quoted speech?
  - ‘Tom thinks that Peter loves Mary.’
    - `love( Peter, Mary )` ?
- Knowledge is changing
  - `instance-of( Pluto, planet )` ?

### Conclusion:

- Ontology learning is difficult.
- What we can learn is fuzzy and uncertain.
- Ontology maintenance is important.

# Ontology Learning Approaches

## Concept Classification

---

- **Heuristics**

- ‘image processing software’

- subclass-of( image processing software, software )

- **Patterns**

- ‘animals such as dogs’

- ‘dogs and other animals’

- ‘a dog is an animal’

- subclass-of( dog, animal )

# JAPE Patterns for Ontology Learning

```
rule: Hearst_1
(
  (NounPhrase) : superconcept

  {Token.string=="such"}

  {Token.string=="as"}

  (NounPhrasesAlternatives) : subconcept
) : hearst1
-->
:hearst1.SubclassOfRelation = { rule = "Hearst1" },
:subconcept.Domain = { rule = "Hearst1" },
:superconcept.Range = { rule = "Hearst1" }
```
