Module 6:
Ontologies and Semantic Annotation
"I like the Internet. Really, I do. Any time I need a piece of shareware or I want to find out the weather in Bogota... I'm the first guy to get the modem humming. But as a source of information, it sucks. You got a billion pieces of data, struggling to be heard and seen and downloaded, and anything I want to know seems to get trampled underfoot in the crowd."

ANNIE Annotations

- We know the type of named entity but nothing more
- What kind of organization is Blackstone Group LP?
- What is the job of William Hague?
- Where is Eastern DRC, what does DRC stand for?

=> only semantics: choice of annotation type name

=> some knowledge hidden deep in JAPE & Code
Need More Semantics:

• To co-reference DRC with “Democratic Republic of Congo”

• To avoid scattered knowledge in JAPE/Java?
  Cities are locations, cities have zip codes, ...

• To disambiguate: which “Washington” (state / city)?

• To use extracted information to allow for queries like:
  • European politicians who visited an African country?
  • Politicians and actors travelling together?

• To use extracted information to add information to our own Database/Knowledge base:
  • Add information about the buying-agreement to our data about Blackstone Group and First Potomac Realty Trust
  • Connect with trading information or other data we have
Semantic Queries in Google

**Paris convention and visitors office - Official website - Paris tourism**

Discover something new
Semantic Enrichment

- Textual mentions aren't actually that useful in isolation
  - knowing that something is a "Person" isn't very helpful
  - knowing which Person the mention refers to can be very useful
- Disambiguating mentions against an ontology provides extra context
- This is where **semantic enrichment** comes in
- The end product is a set of textual mentions linked to an ontology, otherwise known as **semantic annotations**
- Annotations on their own can be useful but they can also
  - be used to generate corpus level statistics
  - be used for further ontology population
  - form the basis of summaries
  - be indexed to provide semantic search
Automatic Semantic Enrichment

- Use Text Mining, e.g.
  - Information Extraction – recognise names of people, organisations, locations, dates, references, etc.
  - Term recognition – identify domain-specific terms
- Automatically extend article metadata to improve search quality
- Example: using a customised GATE text mining pipeline to enrich metadata in the Envia environmental science repository

Mining medical records

- Medical records contain a large amount of unstructured text
  - letters between hospitals and GPs
  - discharge summaries
- These documents might contain information not recorded elsewhere
  - it turns out doctors don't like forms!
  - often information-specific fields are ignored, with everything put in the free text area
Medical Records at SLAM

- NIHR Biomedical Research Centre at the South London and Maudsley Hospital are using text mining in a number of their studies.

- They have developed applications to extract:
  - the results of mental state tests, and the date the test was administered.
  - education level (high school, university, etc.).
  - smoking status.
  - medication history.

- They have even had promising results predicting suicides!
Cancer Research

- Genome Wide Association Studies (GWAS) aim to investigate genetic variants across the whole genome
  - With enough cases and controls, this allows them to state that a given SNP (Single Nucleotide Polymorphism) is related to a given disease.
  - A single study can be very expensive in both time and money to collect the required samples.
- Can we reduce the costs by analysing published articles to generate prior probabilities for each SNP?
Can Semantic Annotation Cure Cancer?

- In conjunction with IARC (International Agency for Research on Cancer, part of the WHO) we developed a text analysis approach to mine PubMed
- We showed retrospectively that our approach would have saved over a year's worth of work and more than 1.5 million Euros
- We completed a new study which found a new cause for oral cancer
  - Oral cancer is rare enough that traditional methods would have failed to find enough cases to make the study plausible
Government Web Archive

- We developed a semantic annotation application to process every crawled page in the archive.
- Entities annotated included; people, companies, locations, government departments, ministerial positions, social documents, dates, money....
- Where possible, annotations were linked to an ontology which
  - was based on DBpedia
  - was extended with UK government-specific concepts
  - included the modelling of the evolution of government
- Annotations were indexed to allow for complex semantic querying of the collection
- An exciting demo coming later, but first the boring stuff you need to know
Why ontologies for semantic search?

- **Semantic annotation**: rather than just annotating the word “Cambridge” as a location, link it to an ontology instance
  - Differentiate between *Cambridge, UK* and *Cambridge, Mass.*

- **Semantic search via reasoning**
  - So we can infer that this document mentions a city in Europe.
  - Ontologies tell us that this particular Cambridge is part of the country called the UK, which is part of the continent Europe.

- **Knowledge source**
  - If I want to annotate *strikes* in baseball reports, the ontology will tell me that a *strike* involves a *batter* who is a *person*
  - In the text “BA went on strike”, using the knowledge that BA is a company and not a person, the IE system can conclude that this is not the kind of strike it is interested in
Example Semantic Search Architecture
What is Semantic Annotation?

Annotation:

*The process of adding *metadata* to [parts of] a document.*

Semantic Annotation:

*Annotation process where [parts of] the annotation schema (annotation types, annotation features) are ontological objects.*
Semantic Annotation: Basic Idea

• Link annotations to concepts in a knowledge base.
• The annotated text is a “Mention” of a concept in the KB
• We can use the knowledge associated with Mentions in our IE pipeline
  – e.g. Persons have JobTitles, Cities have zip codes
• We can use the knowledge associated with Mentions for “Semantic Search”
• We can use semantically annotated documents to add new facts to our knowledge base

=> We need some way to represent knowledge
Knowledge Base

Would want to represent knowledge for this domain:

• Westerwelle:
  has job Foreign minister of Germany → a politician
  Germany → a country, in Europe
Member of the Free Democratic Party
  Free Democratic Party → a political party
  Political party → an organization
...

• Blackstone Group L.P. → a private equity company
  has NYSE symbol: BX
  based in: New York City
  New York City → a city
  located in: New York State which is located in USA
...
Ontology

A formal way to represent knowledge as:

- Concepts of a domain or a set of domains
  “Agelina Jolie”, “Ghana”

- Relationships between concepts
  “New York City is located in New York State”

- Hierarchies of Concepts and Relationships
  “New York City is a City which is a Location”

- Associated Data
  “Blackstone Group has NYSE symbol BX”

- => most widely used formalism is RDF/OWL
What is an Ontology?

- Set of concepts (instances and classes)
- Relationships between them (is-a, part-of, located-in)
- Multiple inheritance
  - Classes can have more than one parent
  - Instances can have more than one class
- Ontologies are graphs, not trees
• Based on RDF(S) - Resource Description Framework (Schema):
  • Everything is identified by an URI: http://dbpedia.org/page/Paris
  • Everything can be expressed as triples of the form
    Subject Predicate Object:
    :City rdfs:subClassOf :Location .
    :Location a rdfs:Class .
    :BlackstoneGroup :hasNyseSymbol “BX” .
  • Simple vocabulary to express things:
    rdf:type = “belongs to a class”
    rdf:Class = “the class of all classes”
    “BX” = the literal string “BX”
• All resources identified by URIs
  Different URIs may refer to the same resource

• Resources that are “Individuals” can be grouped into
  “Classes” and relate to other things and to values by
  “Properties”.

• Values represented through “Literals”:
  “BX” - a string (untyped literal)
  “New York State”@en – string with language tag (untyped)
  “Guido Westerwelle”^^xsd:string – typed literal
  “24”^^xsd:integer

• :A rdf:type :B – :A is contained in class :B
  :B rdf:type rdfs:Class – :B is an RDFS Class
  :B rdfs:subClassOf :C – all members of :B are in :C
OWL Ontologies

- OWL: Web Ontology Language
- Classes/Concepts and Individuals/Instances
- Properties:
  - DatatypeProperty: individual → literal
  - ObjectProperty: individual → individual
  - AnnotationProperty: resource → literal, but no inference

- Inference/Reasoning:
  - Inheritance/Subsumption (classes and properties)
  - “Restrictions”: domain, range, allValuesFrom, hasValue ... infer class membership, property values
  - Open World Assumption: what isn’t asserted, we don’t know
  - Non Unique Name Assumption: different names may be used for same entity

- Classes can have more than one parent, Individuals can belong to more than one class → OWL Ontologies are graphs, not trees
DBpedia

• Machine readable knowledge on various entities and topics, including:
  – 410,000 places/locations,
  – 310,000 persons
  – 140,000 organisations

• For each entity we have:
  – entity name variants (e.g. IBM, Int. Business Machines)
  – a textual abstract
  – reference(s) to corresponding Wikipedia page(s)
  – entity-specific properties (e.g. latitude and longitude for places)
Example from DBpedia

About: Thames Barrier
An Entity of Type: _Feature, from Named Graph: http://dbpedia.org, within Data Space: dbpedia.org

The Thames Barrier is the world’s second-largest movable flood barrier and is located downstream of central London, United Kingdom. Its purpose is to prevent London from being flooded by exceptionally high tides and storm surges moving up from the sea. It needs to be raised (closed) only during high tide; at ebb tide it can be lowered to release the water that backs up behind it.

Links to GeoNames And Freebase
Latitude & Longitude
GeoNames

- 2.8 million populated places
  - 5.5 million alternate names
- Knowledge about NUTS country sub-divisions
  - use for enrichment of recognised locations with the implied higher-level country sub-divisions
- However, the sheer size of GeoNames creates a lot of ambiguity during semantic enrichment
- We use it as an additional knowledge source, but not as a primary source (DBpedia)
Ontologies in GATE

- Can use OWL-Lite ontologies as language resources (→ Plugin Ontology)
- Ontology Editor, Ontology Annotation Tool, Relation Annotation Tool (→ Plugin Ontology_Tools)
- Ontology-enabled JAPE, JAPE Plus
- LKB Gazetteer (→ Plugin Gazetteeer_LKB)
  OntoRoot Gazetteer (→ Plugin Gazetteeer_Ontology_Based)
- Ontology-based evaluation (→ Plugin Ontology_BDM_Computation)
- Java API for ontology manipulation, triple manipulation, SPARQL queries
GATE Ontology Implementation

- Based on Sesame and the OWLIM-Lite SAIL (Storage and Inference Layer) implementation from Ontotext
- Fast in memory repository, scales to millions of statements (depending on RAM)
- In addition to local file ontology, can connect to server:
  - OWLIM Lite
  - OWLIM SE/Enterprise: commercial product, persistent and scalable implementation for huge (billion triples) ontologies
- Java API represents OWL concepts (ontology, property, literal) as Java objects
- Also provides support for SPARQL and manipulating Triples directly
Load Ontology

- Need plugin Ontology
- For Editor, also need plugin Ontology_Tools
- Language Resource → New → OWLIM Ontology

- Loaded:
Ontology Viewer/Editor

- Basic viewing of ontologies
- Some edit functionalities:
  - create new concepts and instances
  - define new properties and property values
  - deletion
- Some limitations of what's supported, basically chosen from practical needs for semantic annotation
- Not a Protégé replacement
John lives in London. He works there for Polar Bear Design.
John lives in London. He works there for Polar Bear Design.
Greece v Argentina: Who wins on penalties?
By Robert Plummer Business reporter, BBC News

Anyone examining the precedents for the Greek financial crisis might well be amused by the draw for next month’s football World Cup matches.

Greece’s players celebrated after qualifying for the 2010 World Cup.

For, as fate would have it, Greece’s foes in Group B include the country that last suffered a comparable economic fiasco: Argentina.

In the worst-case scenario, Argentina’s recent past is Greece’s future.

The peso collapse, massive default and subsequent social and political unrest that rocked Argentina in 2001-2002 are being seen by many economists as an awful warning for the politicians in Athens and Brussels.

As far as football is concerned, the final group match.

But the day of decision for the Greeks is Monday, when they have to stave off default by honouring bonds worth $100bn.

The EU and the IMF have agreed

Original markups
Typical Semantic Annotation pipeline

Corpus → Analyse document structure → Linguistic Pre-processing → NE recognition
                              → Ontology Lookup
                                              → Ontology-based IE
                                                  → Populate ontology (optional)
                                                      → Export as RDF → RDF
Semantic Annotation with other tools: OpenCalais

http://viewer.opencalais.com/

Paste text of http://www.membranes.com/

Since its founding in 1975, Hydronautics has been committed to the highest standards of technology research, products entered the reverse osmosis (RO) water treatment field in 1970, and is now one of the most respected and experienced. Hydronautics became part of the Nitto Denko Corporation when it was acquired in 1987. Hydronautics corporate location California in a 160,000 ft2 (14,684 m2) manufacturing facility residing on 14 acres, all owned by Hydronautics.

Hydronautics' continuing commitment to research and technology results in the ongoing development of a range of products are currently in use on seven continents throughout the world for such diverse applications as potable water, wastewater treatment, surface water treatment, seawater desalination, electronic rinse water, agricultural irrigation and

Comprehensive customer service and support are available virtually around the clock and around the world. Hydronautics network of worldwide sales offices throughout the United States, Latin America, Europe and Asia.

Not easily customised/extended
Domain-specific coverage varies
Zemanta

- Paste text from www.membranes.com

- The main entity of interest “Hydranautics” is missed

- Common problem with general purpose, open-domain semantic annotation tools

- Best results require bespoke customisation
Ontology Learning / Population

- Ontology Population: add new facts to a given ontology. The ontology structure and many classes and individuals are already there:
  “Westerwelle visits Ghana”
  → :GWesterwelle01 :actorOf :Event001 .
  :Event001 a :VisitingEvent .
  ...

- Ontology Learning: also create or extend the structure of the ontology.
Semantic Annotation: How

- Manually
  GATE: ontology based annotation using OAT/RAT or through crowdsourcing

- Automatically
  - Gazetteer/rule/pattern based
    GATE: OntoRoot gazetteer, LKB gazetteer, JAPE, ...
  - Classifier (ML) based – see the YODIE lecture later
  - Combination of the two
Semantic Annotation: The Big Picture

New Ontology

Mimir Server
GATE: Automatic Semantic Annotation

- Ontology aware Gazetteers:
  - LKB Gazetteer
  - Other gazetteers, using inst/class features
- Ontology aware JAPE
- Semantic Enrichment: LKB Gazetteer, JAPE
The LKB gazetteer is used to do ontology-based gazetteer lookup against very large ontologies, e.g. DBPedia, GeoNames and other Open Linked Data ontologies.

Uses a SPARQL query to create a gazetteer list from the ontology:

```sql
SELECT DISTINCT ?label ?inst ?class
WHERE {
  FILTER (lang(?label) = "en")
}
```

Internally retrieves the result rows and converts them to gazetteer entries with inst and class features.

Creates a cache file that will load fast subsequently.
LKB: Continued

- Lives in plugin Gazetteer_LKB
- LKB does not use the GATE ontology language resources. Instead, it uses its own mechanism to load and process ontologies.
- Set up your dictionary first. The dictionary is a folder with some configuration files. Use the samples at GATE_HOME/plugins/Gazetteer_LKB/samples as a guide or download a pre-built dictionary from ontotext.com/kim/lkb_gazetteer/dictionaries.
- The dictionary directory defines which repository to connect to, which SPARQL queries to use to initialise the gazetteer, etc.
- For details see http://gate.ac.uk/userguide/sec:gazetteers:lkb-gazetteer
LKB: Example

- Samples in gate/plugins/Gazetteer_LKB/samples/dictionary_from_remote_repository
- An ontology-based gazetteer of actors from Dbpedia

```
Query:
1. SELECT ?Name ?Person ?Cls
2. FROM <http://www.ontotext.com/disable-sameAs>
3. WHERE {
5.   FILTER (lang(?Name) = "en")
6.   FILTER (?Cls = <http://dbpedia.org/ontology/Actor>)
7. }
```

- Test this query against http://ldsr.ontotext.com/sparql
- Or just try some of the sample queries there
### SPARQL Query Results

</table>
Ontology Aware JAPE

• JAPE transducers have a run-time parameter which is an ontology
• [Note that the ANNIE NE Transducer] does not have this parameter, so you cannot use it for ontology-aware JAPE]
• By default it is left blank, so not used during LHS matching
• When an ontology is provided, the \texttt{class} feature can be used on the LHS of a JAPE rule
• When matching the \texttt{class} value, the ontology is checked for subsumption: any subclass on the left side of “==” matches
• e.g. \{Lookup.class == Person\} will match a Lookup annotation with \texttt{class} feature, whose value is either Person or any subclass of it
Phase: OntoMatching
Input: Lookup
Options: control = appel

Rule: PersonLookup
(  
  {Lookup.class == Person}
):person
-->
:person.Mention =  
{class = :person.Lookup.class,  
  inst = :person.Lookup.inst}
Ontology-aware JAPE example

Ontology-aware JAPE applies only to a feature named “class” and only if the PR's ontology parameter is set.

```
{Lookup.class == "http://example.com/stuff#Person"}
```

Matches this class or any subclass in the ontology

```
{Lookup.class == "Person"}
```

If the string is not a full URI, JAPE adds the default namespace from the ontology, looks up that class in the ontology, and matches it or any subclasses. Be very careful if your ontology uses more than one namespace!

These rules apply equally to the string in the JAPE rule and in the value of the annotation's class feature.
Templates to simplify namespaces

Template declarations can be used to simplify namespaces.

Template: protont =
“http://proton.semanticweb.org/2005/04/protont#$\{n\}”
...
{Lookup.class == [protont n=Person]}
...
{Lookup.class == [protont n=Location]}

If you switch to a newer version of PROTON, you only need to change the Template declarations, not every JAPE LHS. (See the GATE User Guide http://gate.ac.uk/userguide/sec:jape:templates for more details and examples.)

Template: protont =
“http://proton.semanticweb.org/2006/05/protont#$\{n\}”
...
Matching subclasses

David Cameron was the first of the main UK party leaders...

The rule matches because Leader is a subclass of Person.
Semantic Enrichment

- Add additional knowledge to semantically annotated mentions
- Simplest: add features
e.g. add the name of the country, zip code for a city
→ if we have city names to disambiguate, may use zip code to disambiguate!
- Use Java API in JAPE RHS, Groovy or own PR
- SemanticEnrichment PR from the Gazetteer_LKB plugin
  - SPARQL Endpoint (not GATE Ontology LR)
  - Run SPARQL query for each URI in inst
  - add query result to 'connections' feature
Semantic Enrichment PR

• Adding new data to semantic annotations by querying external RDF (Linked Data) repositories

• A semantic annotation is an annotation that is linked to an RDF entity by having the URI of the entity in the ‘inst’ feature of the annotation

• This PR runs a SPARQL query against a given repository and puts a comma-separated list of the values mentioned in the query output in the ‘connections’ feature of the annotation

• Run-time parameters:
  • List of annotation types to enrich and input AS
  • Delete on no relations (true/false)
  • Query
QUESTIONS?
Extra exercises
LKB: Try it

- Samples in `gate/plugins/Gazetteer_LKB/samples/dictionary_from_remote_repository`
- Load the ready-made application `sample_linked_data_mashup.gapp`
- This should load the Movie stars pipeline application
- Temporarily move away the LDSR Enrichment PR from the pipeline, leaving just the documents reset and the entertainers gazetteer
  - that’s pre-built from the SPARQL query shown on the previous page
- Run the pipeline on the sample corpus and inspect the Lookup annotations

Sample text:

Ricky found Ricky at Golden Harvest with a leading role in John Woo’s Money Crazy. In 1979 Games Gamblers Play was released in the Japanese market. For this edition Michael shot a new scene, a fight between Ricky and Sam on the beach, and replaced the original fight. The next Hui brothers production where Ricky teamed up with his brothers again was a successful film featuring the Hui brothers’ Cantonese humor. In the late 1970s Ricky Hui directed and starred in Rags (1979), To Hell with the Devil (1980), Killers (1981), and The Magic Touch (1992). In 1985 the Hui brothers played the roles of straw brothers in the film Man Choi, a memorable role on which Ricky was most active in his film career. First appearance was in The Great Magician (1997). He later released several films such as Super Model and Forever Young, Love Unlimited (1997). He later released seven albums, most of them on vinyl in the 1970s and 1980s. There are three Ricky albums on the market: The Original Ricky, Ricky’s Blues and Ricky’s Rock and Roll. Hui has also released seven albums, most of them on vinyl in the 1970s and 1980s. There are three Ricky albums on the market: The Original Ricky, Ricky’s Blues and Ricky’s Rock and Roll.
Hands On: Semantic Enrichment

- Add the LDSR Enrichment PR back into your pipeline, making sure it is last
- Run the pipeline on the sample corpus and inspect again the Lookup annotations, especially their **connections** feature
- You will need internet connection for this to work

- How do results change, if you modify the query to say LIMIT 1, instead of LIMIT 10?
Modelling social media with ontologies

- SIOC and SIOC Types Ontologies
- SIOC (Semantically-Interlinked Online Communities) Core Ontology provides concepts and properties, describing information from online communities (e.g. wikis, weblogs)
  - Documentation: http://rdfs.org/sioc/spec/#sec-modules
  - Ontology namespace: http://rdfs.org/sioc/ns#
- SIOC Types adds extensions for Twitter modelling
  - Ontology namespace: http://rdfs.org/sioc/types#
- Open the SIOC Types ontology in GATE (in hands-on), by giving the URL as an RDF/XML parameter to the OWLIM Ontology LR
- Double click to view the ontology
MicroblogPost and some properties
SIOC: High Level Overview
Users modelled through the `http://rdfs.org/sioc/ns#UserAccount` class

Useful properties for modelling tweet user info:
- `sioc:description`: corresponds to the description JSON entry
- `sioc:name`, `sioc:email`, `sioc:id`

Properties for relating users to users: `follows`

Properties for relating users to tweets: `creator_of(UserAccount, Post/MicroblogPost)`

Modelling tweets: `http://rdfs.org/sioc/types# MicroblogPost`
- `sioc:content`, `sioc:embeds_knowledge`, `sioc:has_creator`, `sioc:has_reply`, `sioc:links_to`, `sioc:topic`
A word of warning:

- Watch out for the namespaces!
- Some are from SIOC, others – SIOCT, and yet others from other imported ontologies, like SKOS
- E.g. http://rdfs.org/sioc/ns#UserAccount
- Vs http://rdfs.org/sioc/types# MicroblogPost
- In JAPE rules, you need to:
  - Either specify the complete URIs, including the namespaces (unless it is the sioct, which is the default name space for this ontology)
  - Or use templates to shorten the NS URIs and make the JAPEs more readable
